Acknowledgements

I am grateful to the Almighty Allah, Who blessed me with health, wisdom, knowledge, thoughts and opportunity to make some contribution in the form of present effort. I offer my humblest thanks from the deepest core of my heart to the **Holy Prophet Muhammad (Peace be upon him)**, the most perfect and excelled among and ever born on the surface of earth. The research work embodied in this dissertation was accomplished under the able guidance and affectionate supervision of **Assistant Professor Yahya Khurram**, GC University, Lahore. I will always remember his moral encouragement, skillful guidance, positive criticism and valuable advice throughout the course of my study. I also express my feelings of love and respect for my beloved parents that are the real asset of my life and gave me confidence and my best friend also deserve my thanks for their loving encouragement and prayers for my success.

Dedication

My research work is dedicated to my family and my honorable teacher prof Dr. Muhammad Waqas Anwar who encouraged and helped me to complete my research in the area of formal modeling and formal verification related to computer science.

Abstract

The "Track my Shop" project aims to address a significant issue prevalent in the digital era, where small businesses such as service providers, mini stores, and repair shops struggle to establish an online presence due to cost constraints. In response to this, we propose the development of a Web Application Software that acts as a centralized platform for local businesses to connect with their local customer base. By leveraging this application, shopkeepers can extend their reach and increase their earnings by reaching more customers online. Customers, in turn, can easily access and purchase products or avail services from nearby local shops within their specified geographical proximity. The project integrates an image recognition service, allowing sellers to effortlessly add products or services by simply uploading images. On the customer side, this service facilitates image-based search, enhancing the user experience and streamlining the purchasing process.

Chapter 1

Introduction

1.1 Introduction

In an era characterized by rapid technological advancements, businesses are constantly seeking efficient, automated, and precise solutions to streamline their operations. This paradigm shift has led to the creation of numerous software programs tailored to meet the diverse needs of different industries, facilities, and various workplaces. Historically, manual methods were employed for data management, but evolving preferences have spurred a transition to digital solutions. Recognizing the digital divide prevalent among small businesses, particularly those serving local communities, this project, "Track My Shop," endeavors to empower these enterprises and enable their seamless integration into the online marketplace.

In today's digital landscape, the majority of businesses across sectors have embraced online platforms to market and sell their products and services, swiftly reaching customers through home deliveries. However, smaller businesses such as service providers, mini stores, repair shops, and local vendors, including cobblers, barbers, milk shops, bakeries, and spare parts shops, often find it financially challenging to establish an online presence. The "Track My Shop" web application sets out to address this disparity by providing local shops a centralized online platform

to connect with their local customer base. Through this application, shopkeepers can significantly broaden their customer reach, attract a larger audience, and consequently, enhance their earnings with minimal effort of input.

The project envisions simplifying and modernizing operations for local businesses by integrating innovative features such as image recognition for effortless addition of products services, and image-based search capabilities for customers.

1.2 Project Overview

The proposed system, "Track My Shop," is a web-based application designed to facilitate the seamless creation of online shops for sellers. Utilizing image recognition technology, sellers can effortlessly add products or services to their online shop by capturing or uploading images. The system automatically identifies and categorizes the items, making them readily accessible to customers in the vicinity of the shop. Conversely, customers can easily browse and search for products or services using images, names, or proximity filters. They can initiate requests for product delivery or obtain directions to the seller's physical shop, enhancing their overall shopping experience.

1.3 Problem Statement

In the contemporary business landscape, small enterprises encounter a significant barrier in establishing an online platform for their operations due to prohibitive costs associated with web development and maintenance. The high financial investment required often restricts their ability to tap into the potential of the digital marketplace, limiting their growth and outreach.

Furthermore, the traditional method of manually inputting products and services into an online platform has become increasingly burdensome and time-consuming. This arduous process not only consumes valuable time but also poses a hindrance

to the efficient management and scaling of businesses, leading to decreased productivity and suboptimal user experiences.

In addition, both customers and local shops face challenges in connecting efficiently. The conventional approach of physically visiting or relying on word-of-mouth recommendations to discover shops or services is cumbersome and time-intensive. This lack of a seamless and convenient means to connect customers with local shops impedes the potential for increased business transactions and growth for these small enterprises. Therefore, an effective solution is imperative to address these pressing issues and bridge the existing gap between small businesses and their online presence while enhancing accessibility and connectivity for both customers and shops.

1.4 Study Limitations

The primary challenges that impeded the advancement of this project were time and financial constraints. The project involved various financial obligations, including expenses for software development, server deployment, image recognition technology, and geolocation features. Additionally, managing fieldwork, development tasks, and adhering to project timelines was demanding. Despite these constraints, we remained committed to ensuring the accuracy and effectiveness of the web application, striving to meet the expectations and needs of both sellers and customers.

1.5 Literature Review

"Track My Shop" embodies the essence of modern business augmentation through technology. In an era where online presence is paramount, this web application offers a cost-effective solution for small and local businesses to establish their digital footprint. By seamlessly integrating products and services using image

recognition and geolocation features, the application enhances accessibility and connectivity between customers and local shops. It paves the way for an intuitive and efficient shopping experience, bridging the gap between traditional brick-and-mortar stores and the vast digital market. The project encapsulates the vision of empowering businesses and customers alike, promoting growth, efficiency, and a seamless convergence of technology and commerce.

Chapter 2

Requirement Specification

2.1 Functional Requirements

Function and features that derives to the end user of the system are following:

2.1.1 Affordable Online Presence:

Develop a cost-effective solution that enables small businesses to establish and maintain an online platform for their products and services without incurring prohibitive expenses, democratizing access to the digital marketplace.

2.1.2 Streamlined Product/Service Integration:

Create an automated system leveraging image recognition technology to simplify and expedite the process of adding products and services to the online platform, reducing manual effort and improving efficiency for business owners.

2.1.3 Enhanced Customer-Shop Connectivity:

Facilitate easy and efficient connection between customers and local shops by providing a user-friendly interface that allows customers to search for products or services based on images, names, or location, thereby fostering a seamless shopping experience.

2.1.4 Geolocation Features:

Implement geolocation features to enable customers to explore nearby shops and their offerings, aiding in quicker decision-making and fostering a stronger connection between customers and local businesses.

2.1.5 Delivery Request Mechanism:

Integrate a system that allows customers to request product delivery from the respective sellers, promoting convenience and encouraging increased sales for the shops while enhancing customer satisfaction.

2.1.6 Navigation Assistance:

Provide navigation features that guide customers to the physical locations of shops, improving accessibility and encouraging more foot traffic to the local businesses, ultimately boosting their visibility and sales.

2.1.7 User Experience Optimization:

Prioritize an intuitive and appealing user interface and experience to ensure that both sellers and customers find the application easy to use and navigate, enhancing overall satisfaction and encouraging continued usage.

2.1.8 Search History Recording:

Record customer searches to provide a history for their convenience and future reference.

2.1.9 Comprehensive Search Results:

Ensure that search results include a wide array of products, services, and corresponding shops for a complete view of available offerings.

2.1.10 Flexible Result Filtering:

Allow customers to filter search results based on various criteria such as price, ratings, shop proximity, or categories, enabling a personalized and efficient shopping experience.

2.1.11 Delivery Requests for Products:

Implement a mechanism for customers to request product delivery, promoting convenience and seamless transactions.

2.1.12 Navigation to Shops:

Enable customers to obtain directions to the physical shops offering the desired product or service, facilitating a smooth transition from online exploration to in-person shopping.

2.1.13 Category-Based Exploration:

Provide an option for customers to explore products and services based on categories, allowing for effortless browsing without initiating a specific search.

2.2 Non-functional Requirements

Here are the non-functional requirements:

2.2.0.1 Performance

- The web application must have rapid response times and load efficiently.
- API calls for data fetching and processing should complete within milliseconds for a seamless user experience.
- The application should maintain high performance even during peak usage.

2.2.0.2 User Interface (UI) and User Experience (UX)

- The UI should be intuitive, aesthetically pleasing, and utilize vibrant colors with smooth animations.
- The design should be consistent and compatible across various screen sizes and devices.
- User interactions and transitions within the application should be smooth and visually appealing.

2.2.0.3 Compatibility

- The web application must be compatible with a wide range of browsers, ensuring consistent functionality and appearance across different platforms.

2.2.0.4 Scalability

- The architecture should allow for seamless scaling to accommodate a growing user base and increased data load.
- The application should be capable of handling increased traffic without compromising performance.

2.2.0.5 Accessibility

- The application should adhere to accessibility standards to ensure usability for individuals with disabilities.
- Content and features should be easily navigable and understandable for users with basic English skills.

2.2.0.6 Image Storage

- Images should be stored securely in AWS S3 buckets, ensuring data integrity and accessibility.
- The image storage system should handle image uploads, retrievals, and deletions in an efficient and organized manner.

2.2.0.7 Database Management

- The database should be maintained automatically, including regular password changes for enhanced security.
- Database operations should be optimized to ensure data retrieval and modification are swift and efficient.

2.2.0.8 Response Time

- The web application should have minimal loading time, providing near-instantaneous responses to user actions.

2.2.0.9 Reliability

- The application should operate consistently without frequent crashes or downtimes, ensuring a reliable user experience by instantly report and monitor any bugs or errors, enhancing application reliability.

Chapter 3

Project Design

3.1 Methodology

The methodology adopted for designing the "Track My Shop" web application is an iterative process. The methodology encompasses various stages from project initiation to implementation, ensuring an organized and systematic approach as each stage is mentioned below:

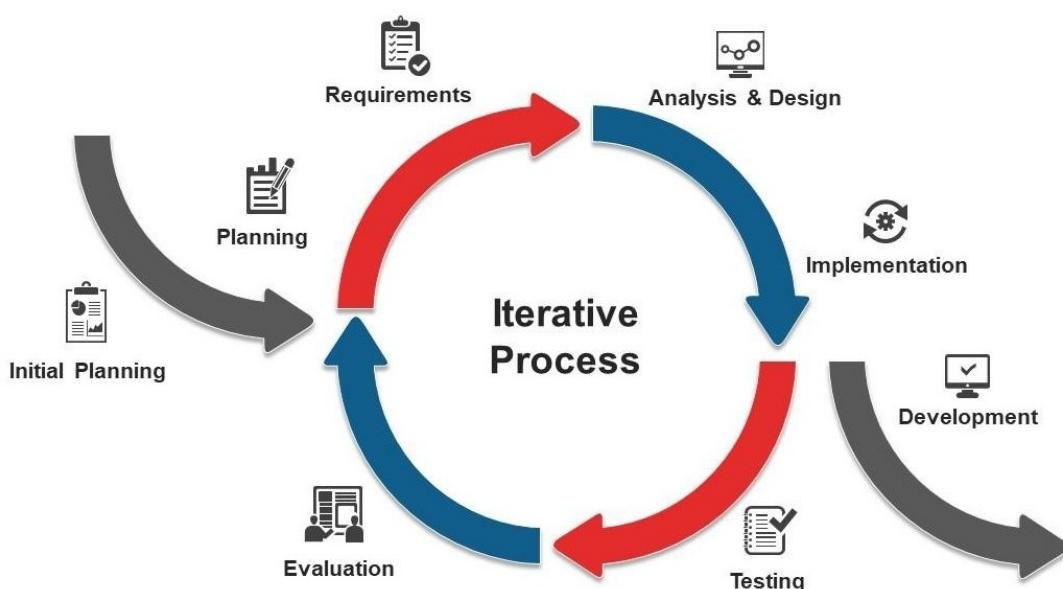

FIGURE 3.1: Iterative Process Model

3.1.1 Initial Planning

In this initial planning stage, the project goals and initial requirements are outlined. Key activities include:

Defining Project Goals: Setting the overall goals and vision for the "Track My Shop" application.

Preliminary Requirement Analysis: Performing an initial analysis of high-level requirements and constraints.

3.1.2 Planning

The planning stage involves planning the upcoming iteration and setting specific goals for it. Key activities include:

Setting Iteration Goals: Defining the objectives and outcomes for the current iteration.

Identifying Resources: Allocating the necessary resources, including manpower, technology, and tools, for the iteration.

3.1.3 Requirements Analysis and Design

In this stage, detailed requirements are gathered and analyzed, and the system's design is conceptualized. Key activities include:

Requirements Refinement: Analyzing and refining requirements based on feedback from previous iterations and stakeholders.

System Design: Conceptualizing the system's design and architecture based on the refined requirements.

3.1.4 Implementation and Development

The implementation stage involves writing code and developing the iteration. Key activities include:

Coding and Development: Writing the code based on the design and architecture defined in the previous stage.

Integration: Integrating the developed components and modules into a cohesive iteration.

3.1.5 Testing

The testing stage involves validating the functionality and performance of the developed iteration. Key activities include:

Functional Testing: Ensuring that the iteration meets the specified functional requirements.

User Acceptance Testing (UAT): Engaging users to validate the iteration against their expectations and requirements.

3.1.6 Evaluation

The evaluation stage involves assessing the outcomes of the iteration. Key activities include:

Evaluation of Goals: Evaluating whether the iteration goals were achieved and identifying areas for improvement.

3.1.7 Summary

The iterative process model is adopted in the development of the "Track My Shop" application, allowing for incremental development, feedback incorporation,

and continuous improvement. Each iteration adds new features, refines existing functionalities, and incorporates feedback for an improved and user-centric product.

3.2 Architecture Overview

3.2.1 Entity Relationship Diagram (ERD)

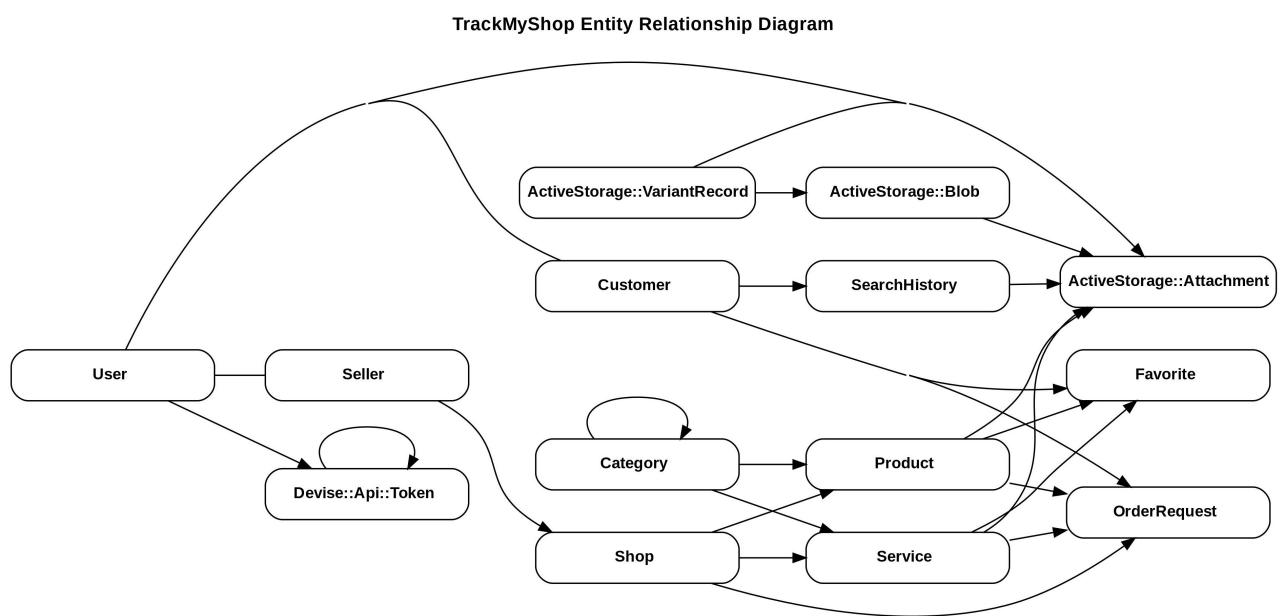

FIGURE 3.2: Track My Shop - Entity Relationship Diagram

3.2.3 Mathematical

A sample for mathematical writing

A team of three robots moving in an environment that is modelled by G . Motion primitives of robots are given by the transition system $\mathbf{T}=(Q_T, q_T^0, \delta_T, \Pi_T, L_T, w_T)$, where $Q_T \subseteq V$, q_T^0 is the initial vertex, $\delta_T \subseteq e$ is a relation that models the

3.2.2 Class Diagram (UML)

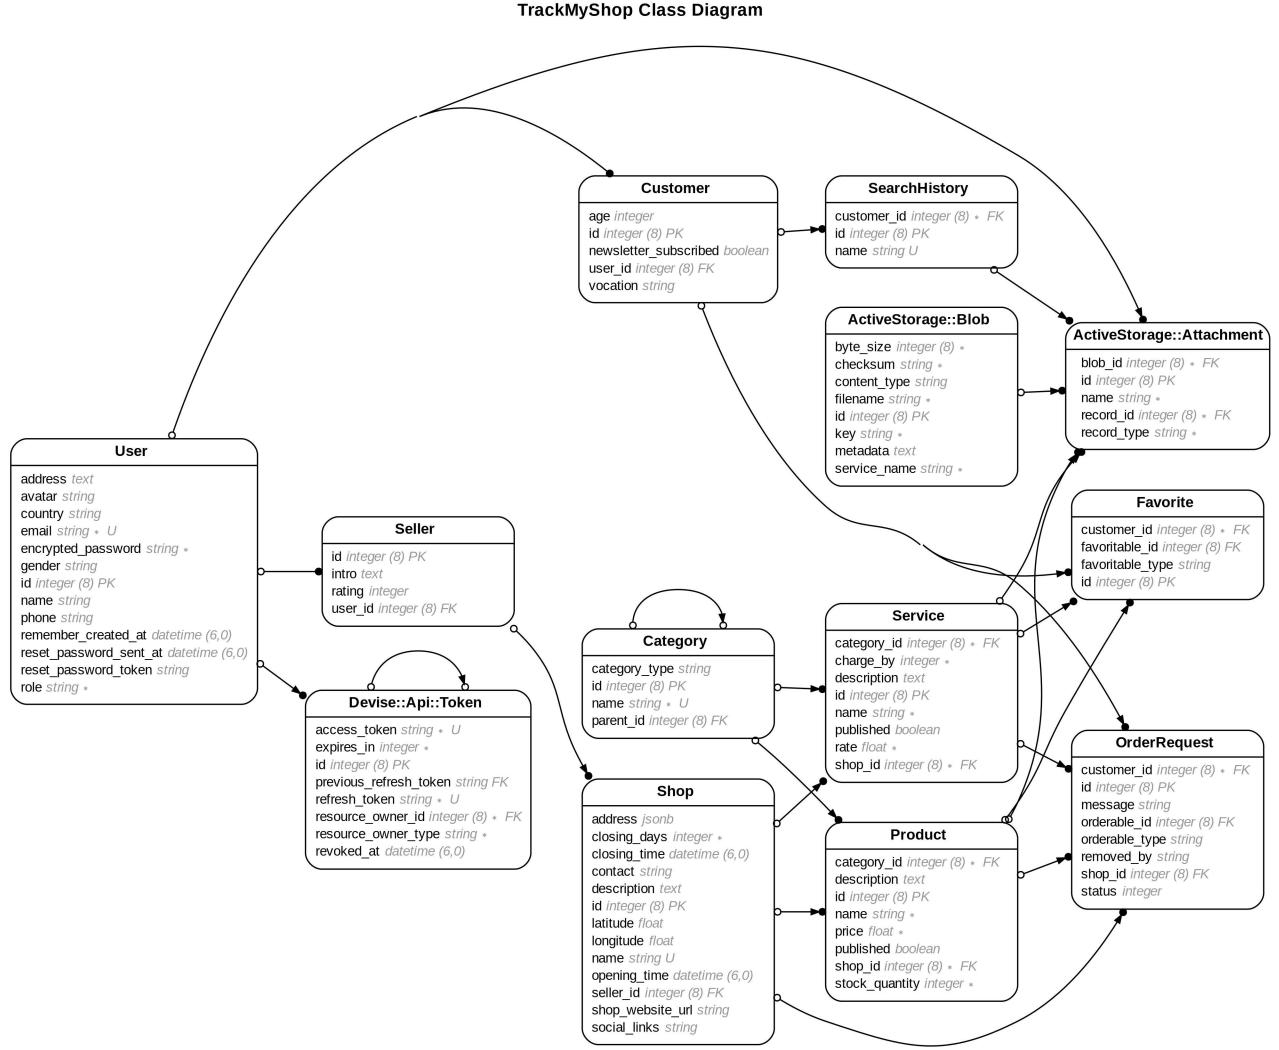

FIGURE 3.3: Track My Shop - Class Diagram

capabilities of robot to move along the vertices, $\Pi_T \subseteq \Pi$ presents the set of propositions that a robot satisfies, L_T is mapping that how propositions are satisfied at some vertex and w_T is weight that a robot went from one vertex to another.

3.3 Design Description

Another format

$$\phi := \psi \wedge GF\sigma \quad (3.1)$$

Chapter 4

Implementation and Evaluation

4.1 Development Stages

Following are the stages of development:

4.1.1 Strategy Stage

We designed our web application while keeping in mind the requirements of our end sellers and customers. In order to make it a success we planned each and everything beforehand. We have learned our users demand and then planned our project on it. We have designed it in such a way that it can be easy to use and handle. After jotting down our requirements we made diagrams so that it can give an outlook of our system. After this we worked on our database and later on its implementation. We also wrote the project code, then we integrated and tested our it to verify if its working.

4.2 Implementation

Following is described about the implementation level things:

4.2.1 Tools and Technologies

1. Server-Side API Framework **Ruby on Rails**
2. Front-End Frameworks:
 - **Next.js** (framework built on REACT Js library)
 - **Bootstrap5** (CSS framework)
 - **Google Material UI** (for interactive components)
 - **Google Maps API**
3. DBMS **PostgreSQL**
4. Version Control System (VCS): **Git, Github**
5. Integrated Development Environment (IDE): **RubyMine, VS Code**
6. API and Web testing tool: **Postman**
7. Data Caching server: **Redis**
8. Hosting Service for API: **Heroku**
9. Hosting Service for Front-End App: **Amazon Static Hosting S3**
10. CI — CD tool: **Github Actions**
11. Media Storage Service: **AWS S3**
12. Image Recognition Service: **AWS Rekognition**
13. Domain Name Service: **AWS Route53**
14. Domain Platform: **Namecheap.me**
15. Bug Report Service: **Sentry**
16. Mailer Service: **Mailjet**

4.3 System Integration

System integration in the "Track My Shop" project is a critical process where all the individual components and modules of the system are combined and tested to ensure they function as a unified, cohesive unit. This integration involves merging the backend functionalities, including database management and server operations, with the frontend user interface to create a seamless and functional application. The integration process also incorporates third-party services, such as image recognition, mapping APIs and Deployment on AWS/Heroku, ensuring their proper interaction within the application. Rigorous testing and validation are conducted to confirm that the integrated system operates smoothly, with data flowing seamlessly between various components.

Achieving a successful integration is vital for delivering a reliable, efficient, and feature-rich web application that can be run on any environment and on any web browser, meets the needs and expectations of both sellers and customers.

4.4 User Interface

The user interface (UI) of the "Track My Shop" project is crafted to deliver a seamless and engaging experience for both sellers and customers. Sellers are provided with a comprehensive dashboard offering insights into their shops, order requests, and sales statistics. They can efficiently manage their shop listings, adding new products/services and updating existing ones. On the other hand, customers are greeted with an intuitive interface that allows effortless browsing of nearby shops and their offerings, categorized for easy exploration. The search functionality is versatile, enabling customers to search by text, images, or based on their preferences. Clear product/service details, interactive maps for shop locations, easy order request processes, and a user-friendly profile management system further enhance the overall usability. The UI is designed to be accessible and responsive to various type of devices and user needs, ultimately fostering a positive and satisfying interaction for all users.

FIGURE 4.8: Shop Trackee - Shop Create

4.4.9 Seller Add Product

The screenshot shows the 'Add Product' page of the Shop Trackee application. At the top, there's a header with the logo 'Shop Trackee', the user name 'Zeeshan Yousaf', and the role 'seller'. Below the header, there are tabs for 'Dashboard' and 'Shops', with 'Shops' being the active tab. The main area is divided into two sections: 'Product Images' and 'Edit Product'. In the 'Product Images' section, there's a placeholder image of a laptop, a 'Choose Files' button, a 'Capture photo' button, and a 'Recognize Image' link. A 'Upload More' button is located at the bottom right of this section. In the 'Edit Product' section, there are fields for 'Name' (Laptop), 'Category' (Electronics), 'Price' (120000), 'Quantity' (2), and a 'Description' text area (It is Electronics, which could be categorized as Technology and Computing). At the bottom right of this section are 'Submit' and 'Back' buttons.

FIGURE 4.9: Shop Trackee - Add Product

4.4.10 Seller Add Service

The screenshot shows the 'Add Service' page of the Shop Trackee application. The layout is similar to the 'Add Product' page, with a header, 'Shops' active tab, and 'Edit Service' section. The 'Service Images' section contains a placeholder image of a light fixture, a 'Choose Files' button, a 'Capture photo' button, and a 'Recognize Image' link. A 'Upload More' button is at the bottom right. The 'Edit Service' section includes fields for 'Name' (Lighting), 'Category' (Event Planning), 'Rate' (1000), 'Charge by' (day), and a 'Description' text area (We offer Lighting on Events, which is Home decor service for your events). 'Submit' and 'Back' buttons are at the bottom right.

FIGURE 4.10: Shop Trackee - Add Service

4.4.11 Seller Products and Services Listing

The screenshot shows a dashboard titled "Shop Trackee" with a "Shops" tab selected. A search bar at the top is set to "Both". There are four main items listed:

- Computer Hardware**: A Sony TV. Description: It is Computer Hardware, which represents a Electronics and Hardware , which could be categorized as Technology and Computing. Price: Rs1 Category: Sports and Outdoors.
- Humidification Service**: A white cylindrical device. Description: It is Healthcare, which is related to Technology and Healthcare. Category: Healthcare.
- Laptop**: A black laptop. Description: It is Electronics , which could be categorized as Technology and Computing. Price: Rs12000 Category: Electronics.
- Lighting**: A long strip of LED lights. Description: It is Lighting , which could be categorized as Home and Indoors. Category: Legal Services.

4.5 Hardware Interface

The "Track My Shop" web application is primarily a software-based system that relies on internet connectivity and web browsers to function. However, there are a few essential hardware components and interfaces that enable its operation:

- Computer Systems (Desktops, Laptops, Tablets)
- Smartphones and Mobile Devices
- Stable Internet Connection
- Cameras (for Image Capture)
- Global Positioning System (GPS) and Location Services
- Input Devices (Keyboards, Mouse, Touchscreens)

4.5.1 Hardware Requirements

Here are some minimal requirements of hardware to run this Web Application:

- Pentium 4 - 1.9Ghz
- RAM 1 GB+
- System Storage (minimum 1 GB)
- Windows, Linux, Mac, Andriod, IOS
- Browsers (Chrome 64+, Edge 79+, Firefox 67+, Opera 51+, Safari 12+)
- GPS WGS 84 (World Geodetic System 1984) datum for Google Maps

4.6 Evaluation

Each element of our website is meticulously designed based on the findings of Market Shop Sellers and Customer Research, which takes into account criteria such as technical knowledge, and comprehension. The user is given a seamless experience, allowing them to easily see, update, upload, and manage their data. While designing the website, Human Computer Interaction concepts were taken into account, allowing the user to see where they are presently working and easy to use. Before releasing the website, we make sure that all of the tabs and buttons are visible and double-checked and everything is working properly. Once the website is ready for the user, it will be extensively tested and any necessary changes will be done. Hence the website is user friendly and unambiguous.

4.7 Unit Testing

4.8 Functional Testing

4.8.1 Testing Requirements

4.9 Requirements

Some more samples of tables

Another sample for Table

Algorithm 1: Group-TS

Input: Transition system of each member $\{T_1, T_2, T_3\}$.

Output: Combined Transition System of members that is \mathbf{T} .

1. Let $m = 1, 2, 3$
2. $q_T^0 = q_m^0$.
3. recursive search on \mathbf{T} starting from initial state (q_T^0).
4. $q_m \in q$.
5. The transition of T_m is defined as \rightarrow_m . where $\rightarrow_m = (q, q')$
6. τ : set of possible transitions and $\rightarrow_m \in \tau$ then do.
7. ω = minimum weight of \rightarrow_m when the robot finds some region.
8. Find new state of transition system that is q' and if q' not exists then.
9. Insert the state q' to \mathbf{T} .
10. Insert new transition to δ_T with assigning the weight ω . where δ_T is the set of transitions.
11. prolong search from new state q'
12. else if there is no transition for (q, q') then
13. Include transition that is from (q, q') to δ_T with assigning the weight ω

TABLE 4.1: (a) Results after running the Transition System

| \mathbb{T} | 0 | 2 | 3 | 4 | 6 | 8 | 10 | ... |
|--------------|-----------------|-------------------------|-----------------------|--------------------|--------------------|--------------------|--------------------|-----|
| $r*_{group}$ | q_0, q_0, q_0 | q_1, q_1, q_1 | $q_1 q_0 1, q_2, q_3$ | q_0, q_1, q_2 | q_1, q_0, q_3 | q_0, q_1, q_2 | q_1, q_0, q_3 | ... |
| $L_T(.)$ | . | p_1, p_2, p_4, σ | p_3, p_5 | p_2, p_6, σ | p_1, p_5, σ | p_2, p_6, σ | p_1, p_5, σ | ... |
| r_1^* | q_0 | q_1 | . | q_0 | q_1 | q_0 | q_1 | ... |
| r_2^* | q_0 | q_1 | q_2 | q_1 | q_0 | q_1 | q_0 | ... |
| r_3^* | q_0 | q_1 | q_3 | q_1 | q_0 | q_1 | q_0 | ... |

We assume in Table 4.1 the first row shows the time when the transition occurs, second row represents the run $r*_{group}$, third row corresponds to the satisfied propositions, and last three rows shows the separate run of these three robots. We observed in the optimal run that (q_0, q_0, q_0) , (q_1, q_1, q_1) , $(q_1 q_0 1, q_2, q_3)$ is prefix and (q_0, q_1, q_2) , (q_1, q_0, q_3) is suffix cycle and that will be repeated an infinite number of times. The given time which satisfies the σ is $\mathbb{T}^\sigma = \{2, 4, 6, 8, 10, \dots\}$ and the function defined in (3.2) is $C(\mathbb{T}) = 2$.

Now, the time sequence when σ is repeatedly satisfied is $\mathbb{T}^\sigma = \{2, 4, 6, 8, 10, \dots\}$ and cost function is given as;

$$\begin{aligned} C(\mathbb{T}) &= \lim_{k \rightarrow +\infty} (\mathbb{T}(k+1) - \mathbb{T}(k)) \\ &= \mathbb{T}(k+1) - \mathbb{T}(k) \\ &= 4 - 2 = 2 \end{aligned}$$

As $C(\mathbb{T}) = 2$ is the obtained function where the σ is repeatedly satisfied. At $t=3$, robot2 has reached at q_2 while the robot1 is still moving from q_1 to q_0 , therefore r_1^* has no correlated state to $t=3$.

4.9.1 Accurate Specified Run

In Algorithm.2 the exact solution is summarized and it shows that a particular solution is given to a specified problem for that case where robots have exact time

information.

Algorithm 2: Accurate-Run

Input: $\{T_1, T_2, T_3\}$ & LTL formula ϕ .

Result: Different runs of each system in the form $\{r_1^*, r_2^*, r_3^*\}$ that satisfies ϕ .

1. $n = 1, 2, 3$
2. Model the group transition system \mathbf{T} .
3. Now search runs $r*_{group}$ for the system as done in Table.1.
4. Trace runs $r*_{group}$ on the transition systems T_n to obtain the runs r_n^* .
5. Then find obtained function where σ is satisfied.

As the grouped transition system \mathbf{T} is constructed by using Algorithm.1 to model the team. After that we obtain a run $r*_{group}$ on \mathbf{T} that satisfies the LTL formula.

TABLE 4.2: (b) Results after running the Transition System

| \mathbb{T} | 0 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | ... |
|--------------|-----------------|-------------------------|-----------------------|--------------------|-----------------------|-------------------------|-----------------------|--------------------|-----------------------|-----|
| $r*_{group}$ | q_0, q_0, q_0 | q_1, q_1, q_1 | $q_1 q_0 1, q_2, q_3$ | q_0, q_1, q_2 | $q_0 q_1 1, q_2, q_3$ | q_1, q_1, q_1 | $q_1 q_0 1, q_2, q_3$ | q_0, q_1, q_2 | $q_0 q_1 1, q_2, q_3$ | ... |
| $L_T(.)$ | . | p_1, p_2, p_4, σ | p_3, p_5 | p_2, p_6, σ | p_3, p_5 | p_1, p_2, p_4, σ | p_3, p_5 | p_2, p_6, σ | p_3, p_5 | ... |
| r_1^* | q_0 | q_1 | . | q_0 | . | q_1 | . | q_0 | . | ... |
| r_2^* | q_0 | q_1 | q_2 | q_1 | q_2 | q_1 | q_2 | q_1 | q_2 | ... |
| r_3^* | q_0 | q_1 | q_3 | q_1 | q_3 | q_1 | q_3 | q_1 | q_3 | ... |

Now similarly in Table 4.2 the first row shows the time when the transition occur, second row represents the run $r*_{group}$, third row corresponds to the satisfied propositions, and last three rows shows the separate run of three robots. As we observed in the optimal run that (q_0, q_0, q_0) , (q_1, q_1, q_1) is the prefix and $(q_1 q_0 1, q_2, q_3)$,

$(q_0, q_1, q_2), (q_0 q_1 1, q_2, q_3), (q_1, q_2, q_3)$ is the suffix cycle and that will be repeated an infinite number of times. The given time which satisfies the σ is $\mathbb{T}^\sigma = \{2, 4, 6, 8, 10, \dots\}$ and the function defined in (3.2) is $C(\mathbb{T}) = 2$.

Now as we done in Table 4.1 similarly the same procedure for this run shown in Table 4.2, the time sequence when σ is repeatedly satisfied is $\mathbb{T}^\sigma = \{2, 4, 6, 8, 10, \dots\}$ and cost function is given as;

$$C(\mathbb{T}) = \lim_{k \rightarrow +\infty} (\mathbb{T}(k+1) - \mathbb{T}(k))$$

$$= \mathbb{T}(k+1) - \mathbb{T}(k)$$

$$= 4 - 2 = 2$$

As $C(\mathbb{T}) = 2$ is the obtained function where the σ is repeatedly satisfied.

For some applications including new states and corresponding transitions to the structure of the robotic system may indicate to introducing advance stages or motion commands at some lower level. So the proper way in which the changes of these models are strictly application specific and we do not consider such details in our work. Assuming that these changes can be implemented in future.

4.9.2 Synchronized Specification

If there is a situation in which robots are moving at uncertain time and ϕ is not satisfied then we consider individual synchronization run for the robots that helps in guarantee the correctness of the model. In Algorithm.3 the protocols which is followed by the robots for synchronization in the field.

Algorithm 3: Synchronized-Move

Input: r_i and sequence s_i of $robot_i$

Result: Simple synchronized moves for each robot that satisfies ϕ .

- Initialized z at 0 and while True do
 - 1. report all the members.
 - 2. wait until all members received their information message.
 - 3. after satisfying propositions at r_i^z create a transition to r_i^{z+1} .
 - 4. $z = z + 1$.

Chapter 5

Conclusion & Future Work

5.1 Conclusion

The "Track My Shop" project introduces a user-friendly and affordable web application tailored for small businesses and local service providers. By offering a centralized platform accessible through standard web browsers on various devices, the project enables businesses to showcase their products and services online. Leveraging image recognition and geolocation features, the application simplifies the process of product listing and enhances the search experience for customers.

The main focus of the project has been to make digitalization affordable and accessible for small businesses. Through a well-structured codebase and an intuitive user interface, the application ensures a seamless and engaging experience for both sellers and customers. The use of modern technologies like Next.js, Ruby on Rails, AWS, and PostgreSQL ensures the application is robust and scalable.

Moving forward, gathering user feedback and staying updated with evolving technologies will be key to refining and improving the application. "Track My Shop" strives to contribute to a more connected digital economy, facilitating a stronger bond between local businesses and their communities.

5.2 Future Work

While achieving its core objectives, offers exciting avenues for future enhancements and expansions:

5.2.1 Enhanced User Experience:

Conduct usability testing and gather extensive user feedback to refine the user interface, making it even more intuitive and appealing to a broader user base.

5.2.2 Machine Learning Integration:

Explore the integration of machine learning algorithms to enhance the image recognition capabilities, allowing for more accurate and efficient product and service identification from uploaded images.

5.2.3 Facial Recognition

Investigate the possibility of integrating facial recognition technology for profile data completion using profile image and enhanced security within the application.

5.2.4 Personalized Recommendations:

Implement recommendation algorithms based on user preferences and behavior, offering personalized product and service recommendations to customers, thereby enhancing user engagement and sales.

5.2.5 Integration of Payment Gateways:

Incorporate secure and widely used payment gateways to facilitate online transactions directly within the application, streamlining the purchase process for customers.

5.2.6 Multi-Language Support:

Introduce multi-language support to make the application accessible to a more diverse audience, promoting inclusivity and user engagement across different regions and languages.

5.2.7 Real-Time Chat and Customer Support:

Integrate a real-time chat feature to enable direct communication between customers and sellers, fostering better customer support and trust.

5.2.8 Inventory Management System:

Develop an integrated inventory management system for sellers to efficiently track, manage, and update their product and service offerings in real-time.

5.2.9 Social Media Integration:

Integrate social media sharing functionalities to enable users to easily share their favorite products and services with their social network, enhancing the application's reach and user engagement.

5.2.10 Third Party Integration for Sign-in:

Integrate popular third-party authentication services (e.g., Google (for Google My Business), Facebook, Instagram etc.) to allow users to sign in using their existing credentials, enhancing user onboarding and convenience.

5.2.11 Integration with Other E-commerce Platforms:

Investigate the potential for integrating with established e-commerce platforms to allow seamless synchronization of product listings and sales, potentially broadening the reach and opportunities for sellers.

5.2.12 Customer Analytics Dashboard:

Create a comprehensive analytics dashboard for sellers, providing insights into customer behavior, purchase patterns, and popular products, aiding in informed business decisions.

5.2.13 Mobile Application Development:

Extend the project by developing dedicated mobile applications (iOS and Android) to cater to the increasing number of users accessing the platform via mobile devices.

5.2.14 Offline Access and Progressive Web App (PWA):

Implement Progressive Web App features to ensure limited functionality and access to the application even in offline mode, enhancing user experience.

5.2.15 Import data from Business Websites:

Explore features that allow sellers to import or list their existing products or services from already established business websites, streamlining the onboarding process and saving time for sellers.

5.2.16 Integration with Local Services:

Collaborate with local delivery services to enable seamless integration for order deliveries, further enhancing convenience for customers and boosting sales for sellers. These future directions offer a glimpse into the potential growth and evolution of the "Track My Shop" project, ensuring its continual adaptation to emerging technologies and the evolving needs of both businesses and consumers in the dynamic digital landscape.
